EGRET/GRO gamma-ray sky map, $E > 100$ MeV

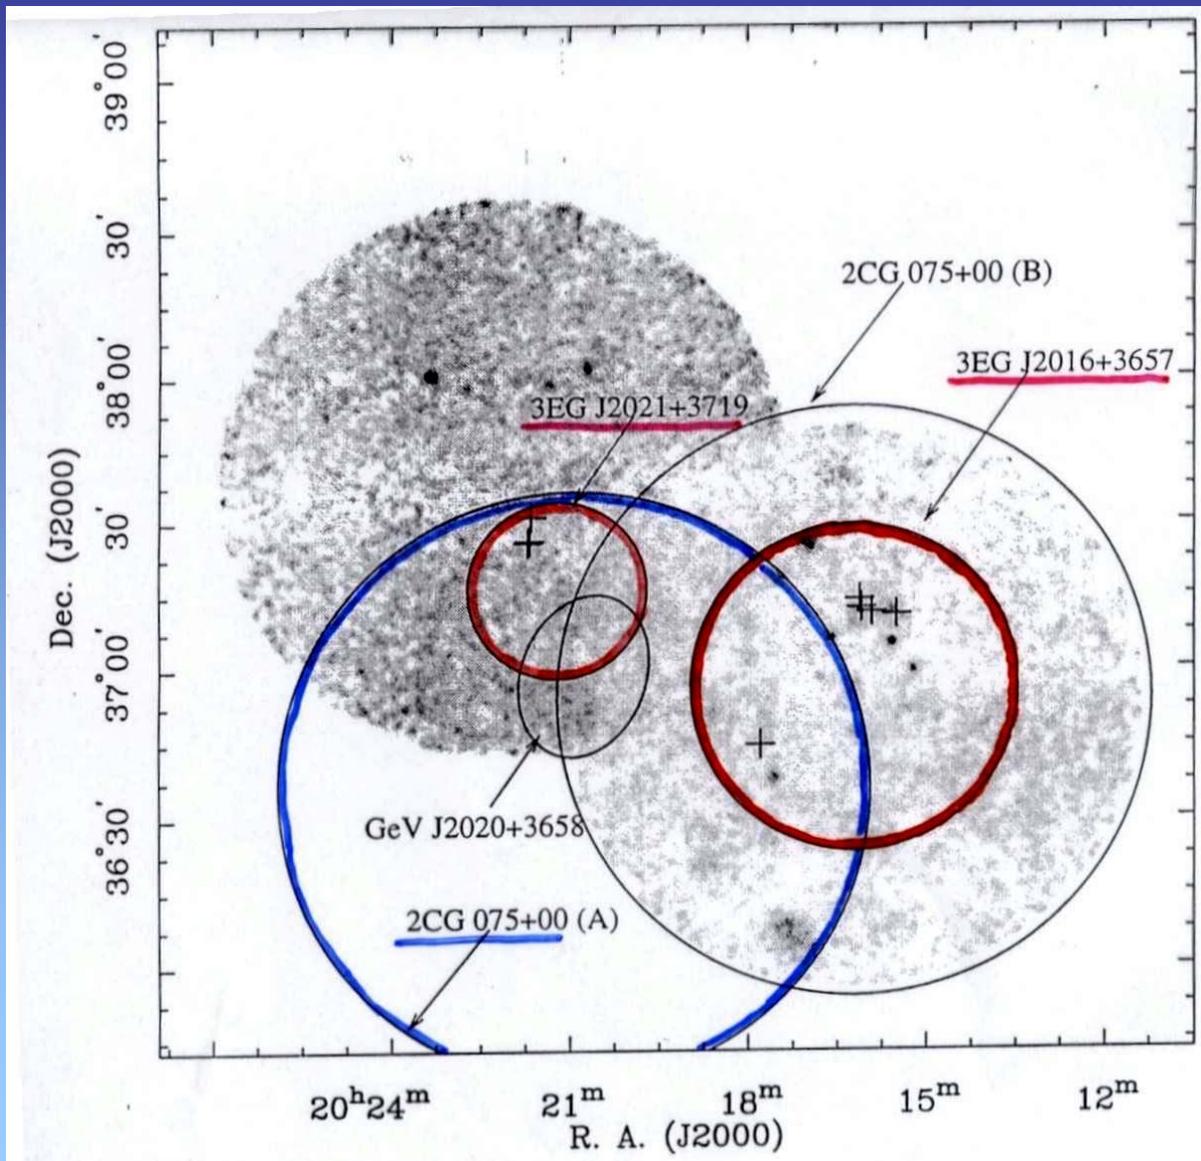

The challenge of the unidentified gamma-ray sources

Sorgenti Gamma non Identificate

Identifications: difficult business...

The future

- **AGILE (2006-2008)**
- **GLAST (2007-2011 and beyond)**

To make progress we need:

- **Excellent gamma-ray imaging with a large Field-of-View**
- **Simultaneous broad-band spectral information**
- **Microsecond timing**
- **Efficient transient detection and alerts**

For both AGILE and GLAST the goal is

“arcminute” γ -ray astrophysics

employing two very different methods:

1. Using the **simultaneous** imaging information in the 15-45 keV and 30 MeV-30 GeV (by AGILE)
2. Using a large collecting area for imaging in the 30 MeV-100 GeV range (by GLAST)

Anticoincidence System

(INAF-IASF-Milano)

AC System (INAF-IASF Milano: F. Perotti et al.)

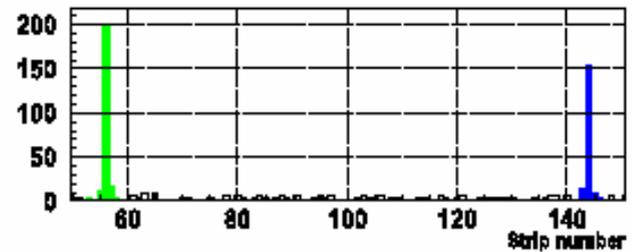

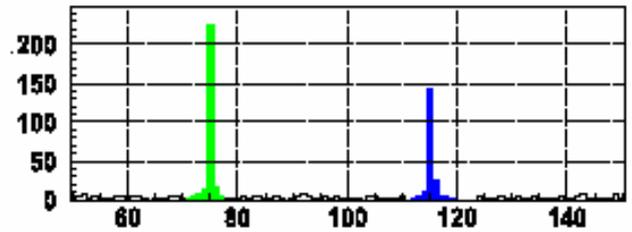

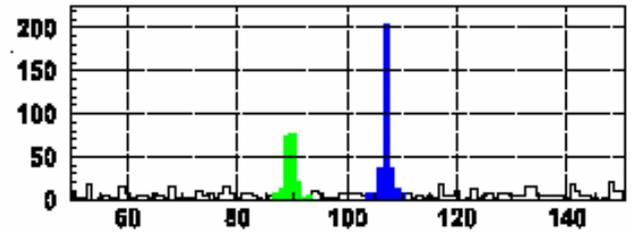

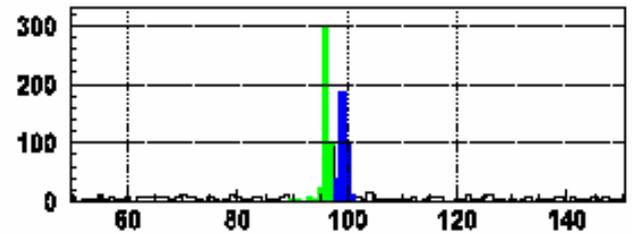

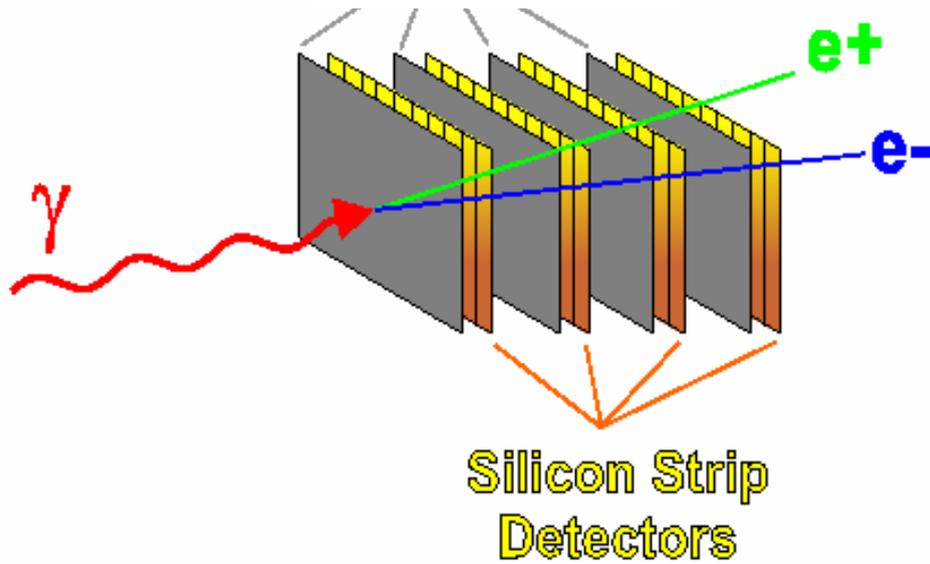

The AGILE Anticoincidence System developed by INAF-IASF Milano (F. Perotti) during the vibration test campaign (January 2005).

Detection inefficiency of the 12 Lateral_Side AC detectors, measured at 23.5 cm from the top edges along the main axis of symmetry.

Silicon Tracker
